1 Background

2 Site Selection

3 Field Data Collection and Analysis

4 Regional Curve Development

5 Summary

1 Background

What's the Problem?

- Natural Channel Design is challenging
- Bankfull is critical
- Channels that need restoration seldom have reliable bankfull indicators

What is a natural channel?

- Alluvial or semi-alluvial
- In grade
- Fluvial processes not excessive
- Some bank erosion or deposition is expected

How is channel size estimated?

- HEC-RAS – Theoretical
- Reference Reach – Empirical (one site)
- Regional Curve – Empirical (many sites)

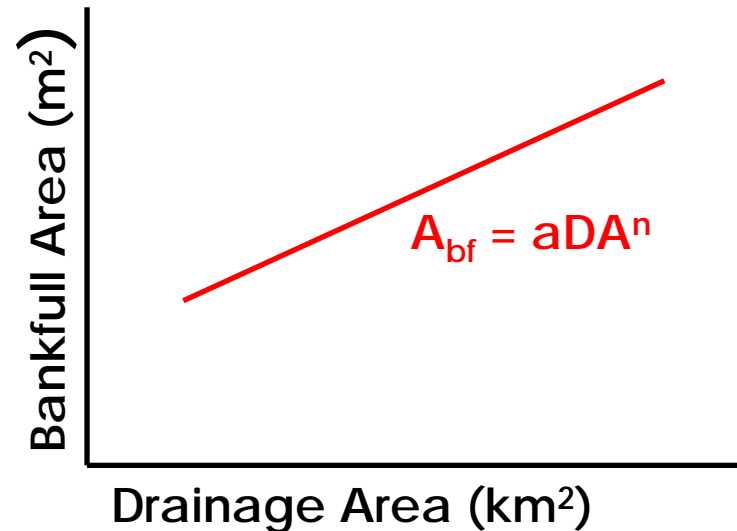

How is channel size estimated?

- HEC-RAS – Theoretical
- Reference Reach – Empirical (one site)
- Regional Curve – Empirical (many sites)

What is a Regional Curve?

Plot of bankfull area versus drainage area

Stantec Scientific Research and
Experimental Development
Grant: SCL-2013A-1603-07

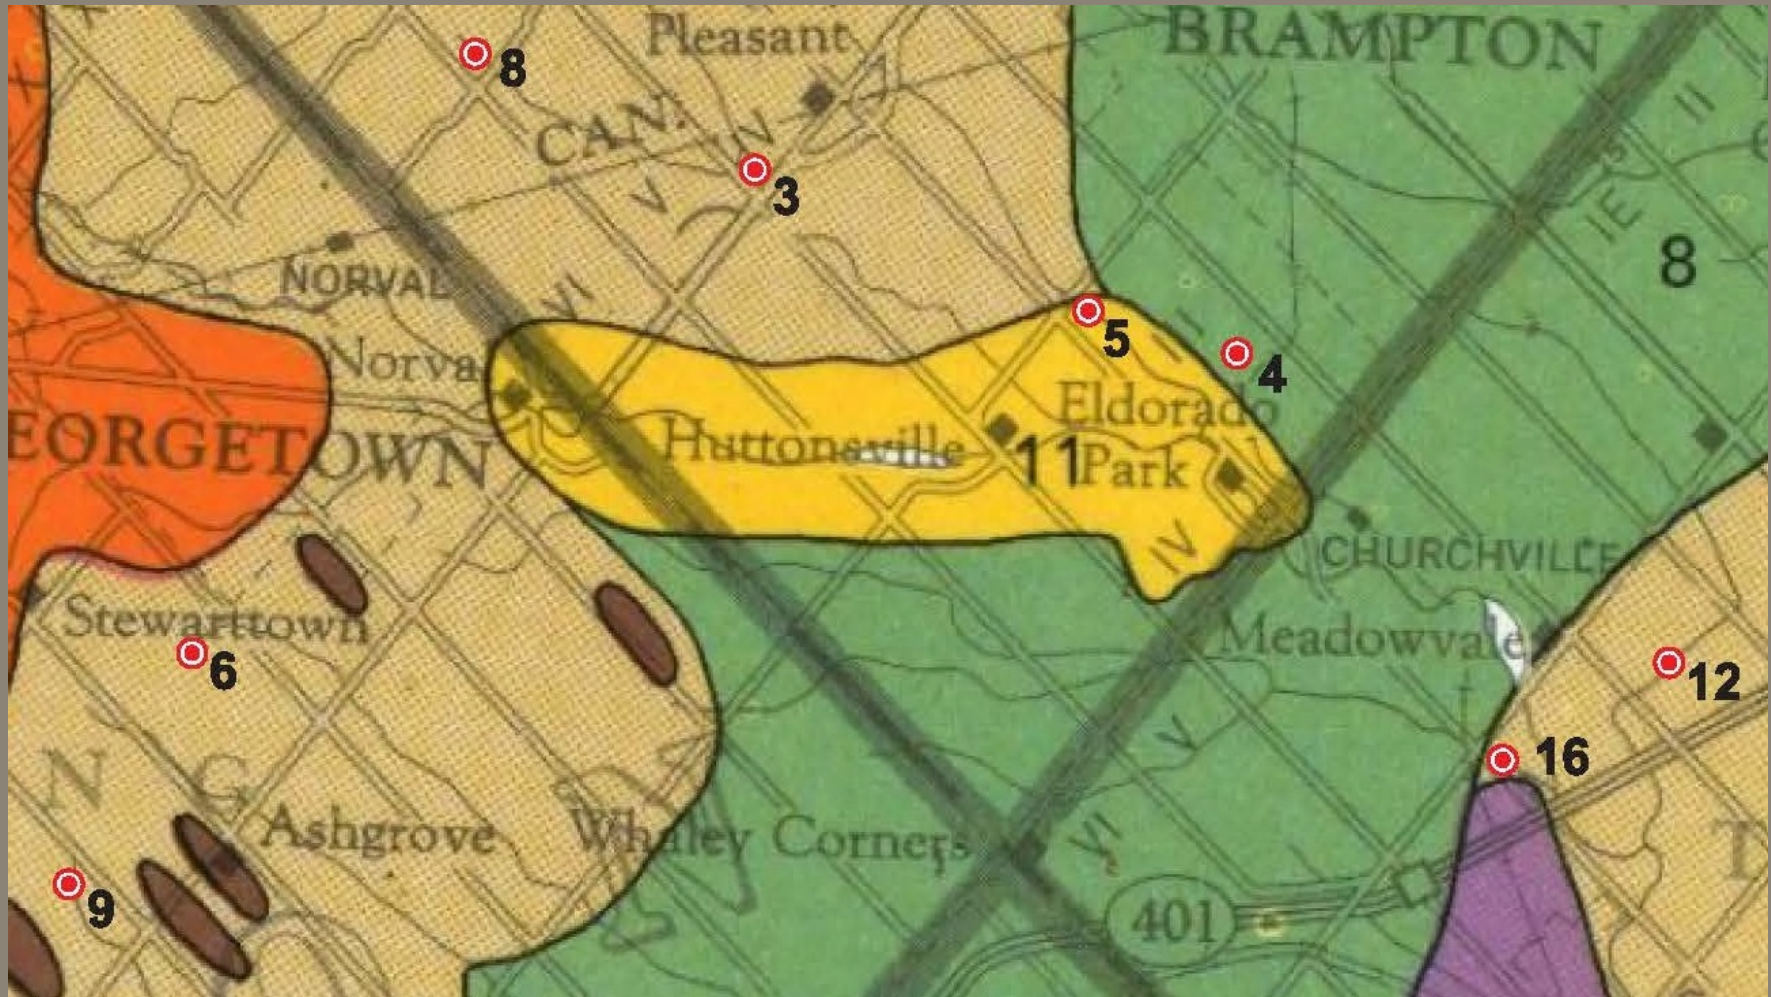

Why use Regional Curves?

- Aid to designers
- Aid to regulators
- Independent check of other methods
- Simple application

2 Site Selection

Three Regions Selected

- Close to urban areas
- Areas where channel restoration likely

- **WATERLOO REGION**
- **PEEL REGION**
- **YORK-DURHAM REGION**

Desktop Assessment

- Drainage areas 1 km² to 200 km²
- Similar geology and precipitation
- Unregulated flows
- Slope 0.5% – 1.0%
- Safe access

Field Verification

- Stable channel
 - Fluvial processes not excessive
 - Good floodplain connection
 - No sediment wedges
- Confirm geology
- Reliable bankfull features

Field Verification

3 Data Collection & Analysis

Equipment

- Survey grade GPS
- Total station
- Engineering rod & level and tape

Data Collected

Identifying Bankfull

- Walk channel
- Look for consistency
- Local disturbances
- Inner berm

Data Collected

- Channel cross-sections (width, depth, area)
- At riffles (3-4 if possible)
- Inner berm
- Slope, grain size
- Photographs

Data Analysis

- RiverMorph software
- Cross-sections plotted
- Dimension based on site average
- Plot bankfull dimension against drainage area
- Regression analysis

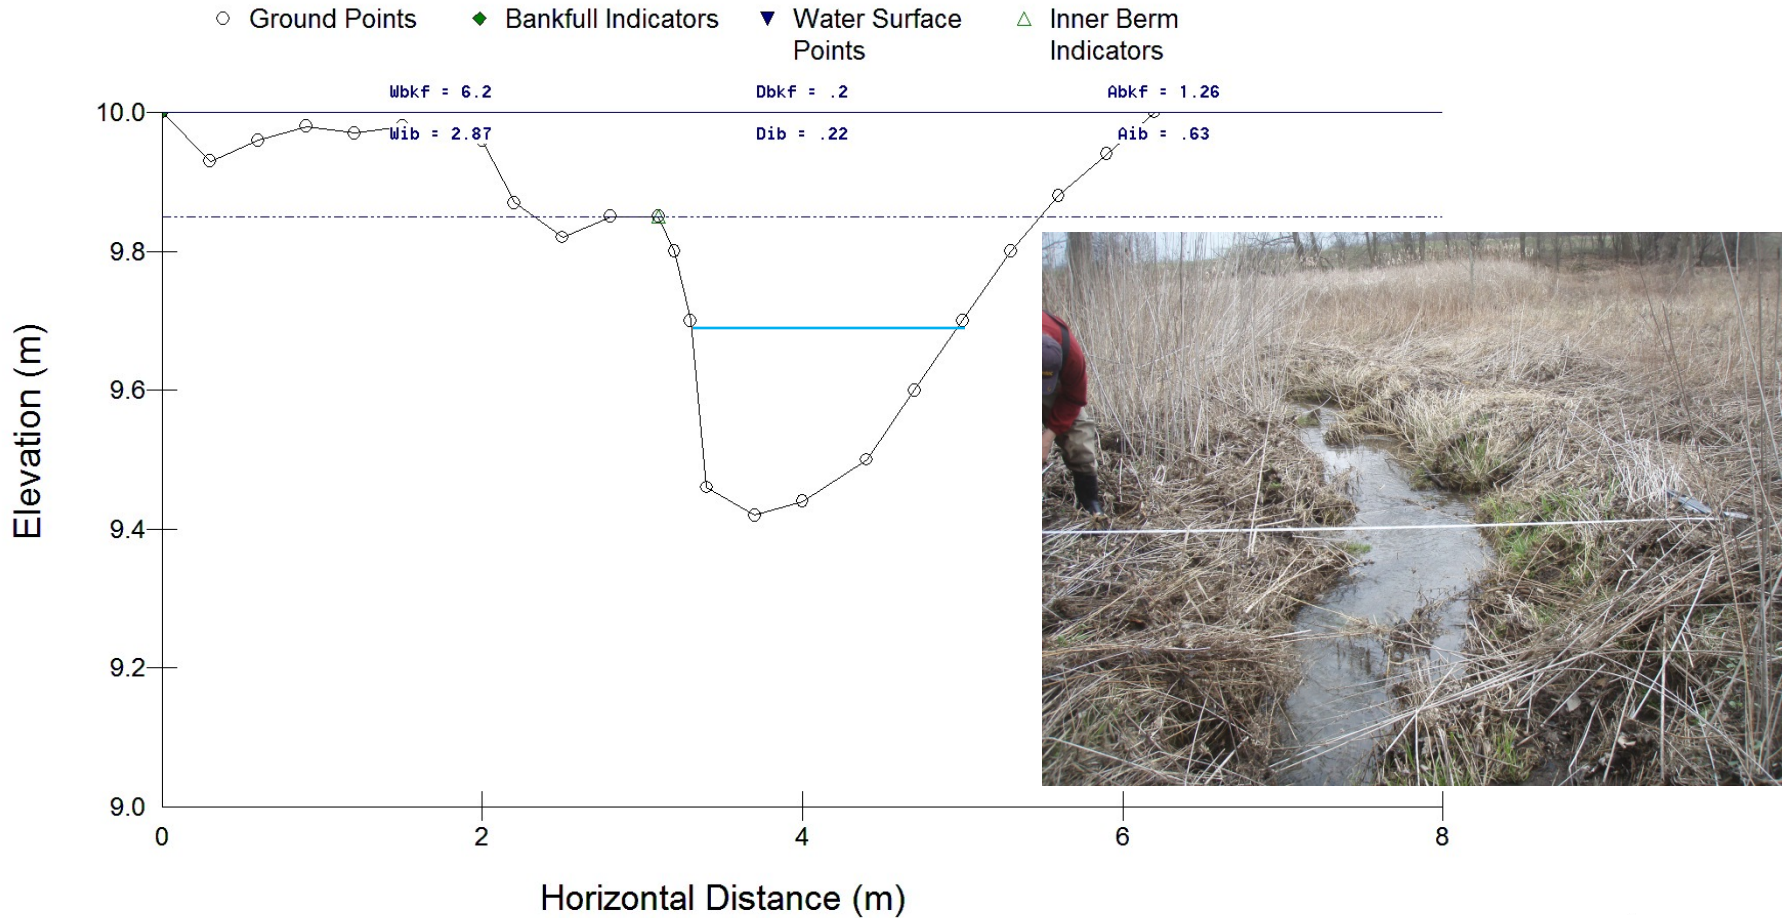

Inner Berm

- Common in alluvial channels
- Lower than bankfull
- Depositional feature
- Low flow channel
- Enhances habitat
- Enhances sediment transport

Data Analysis

East 16 Mile Creek Trib XS-1

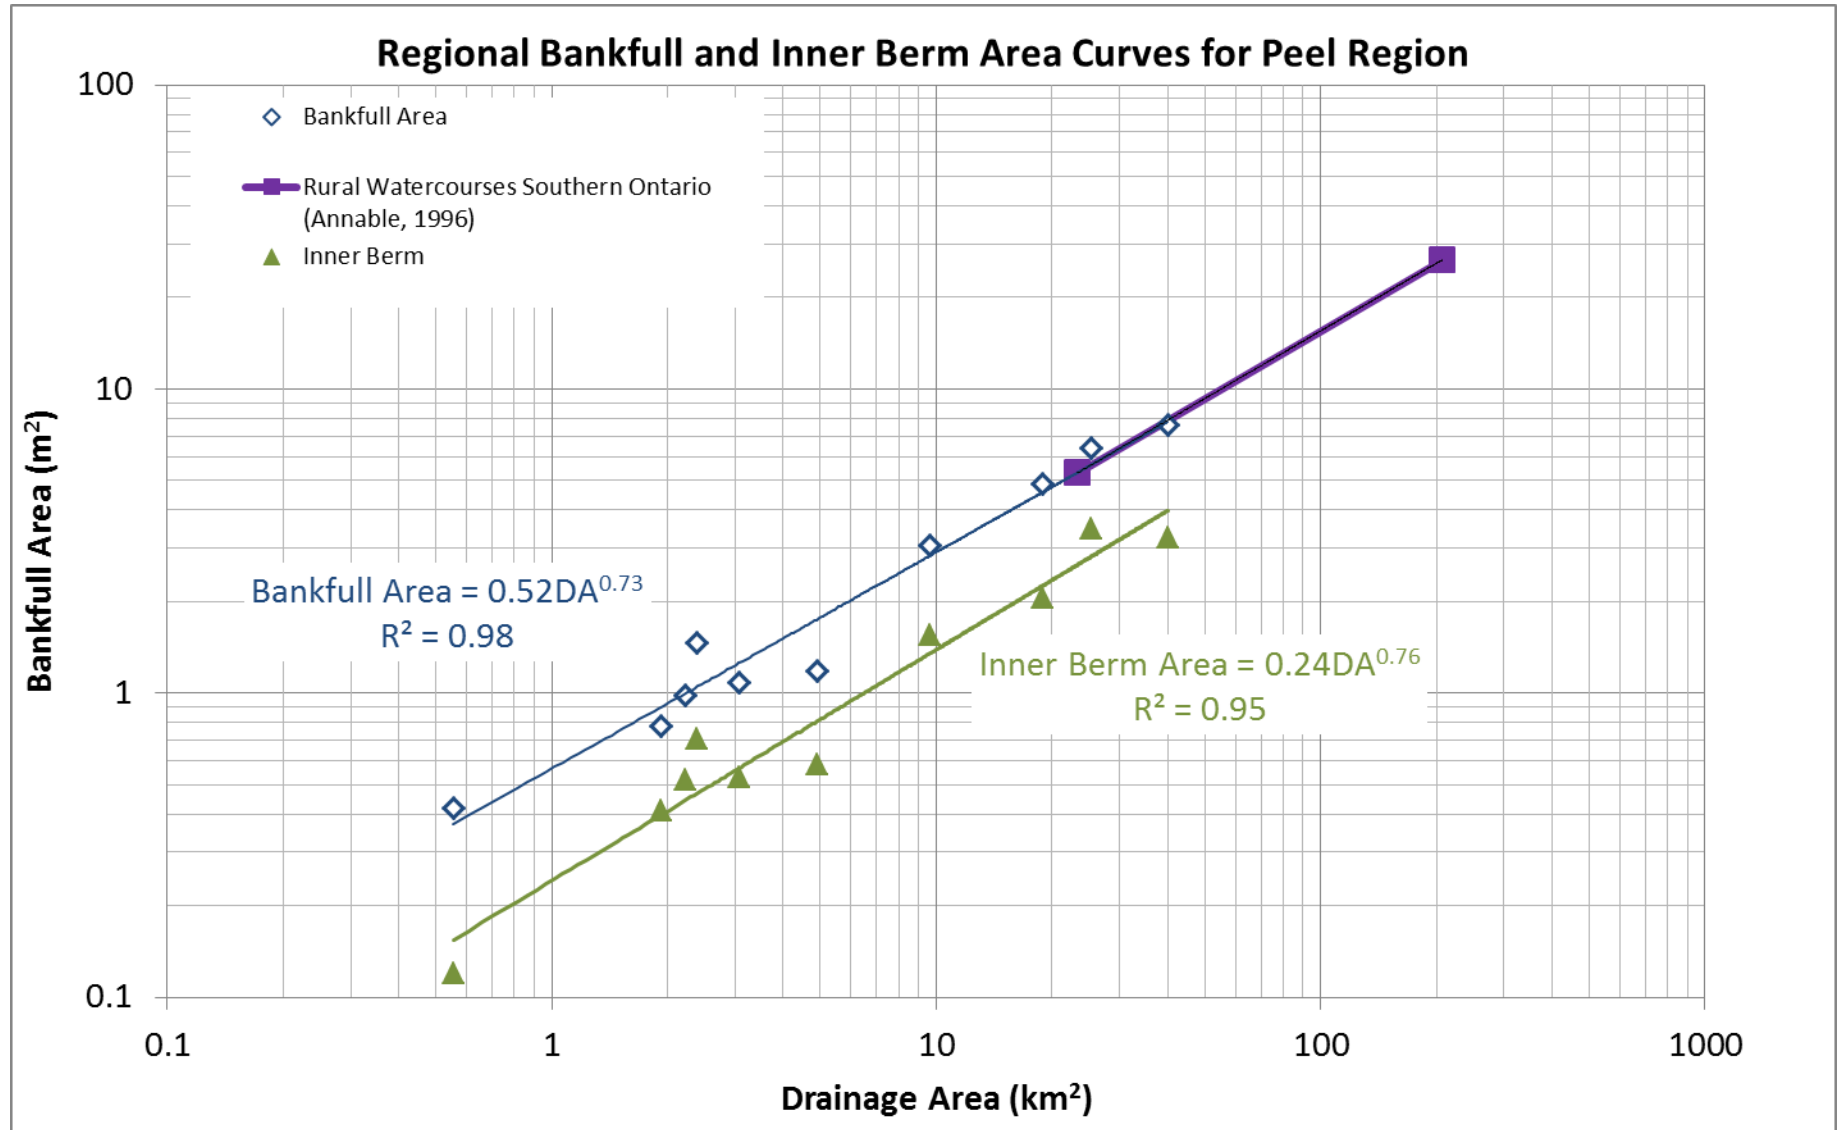

4 Regional Curve Development

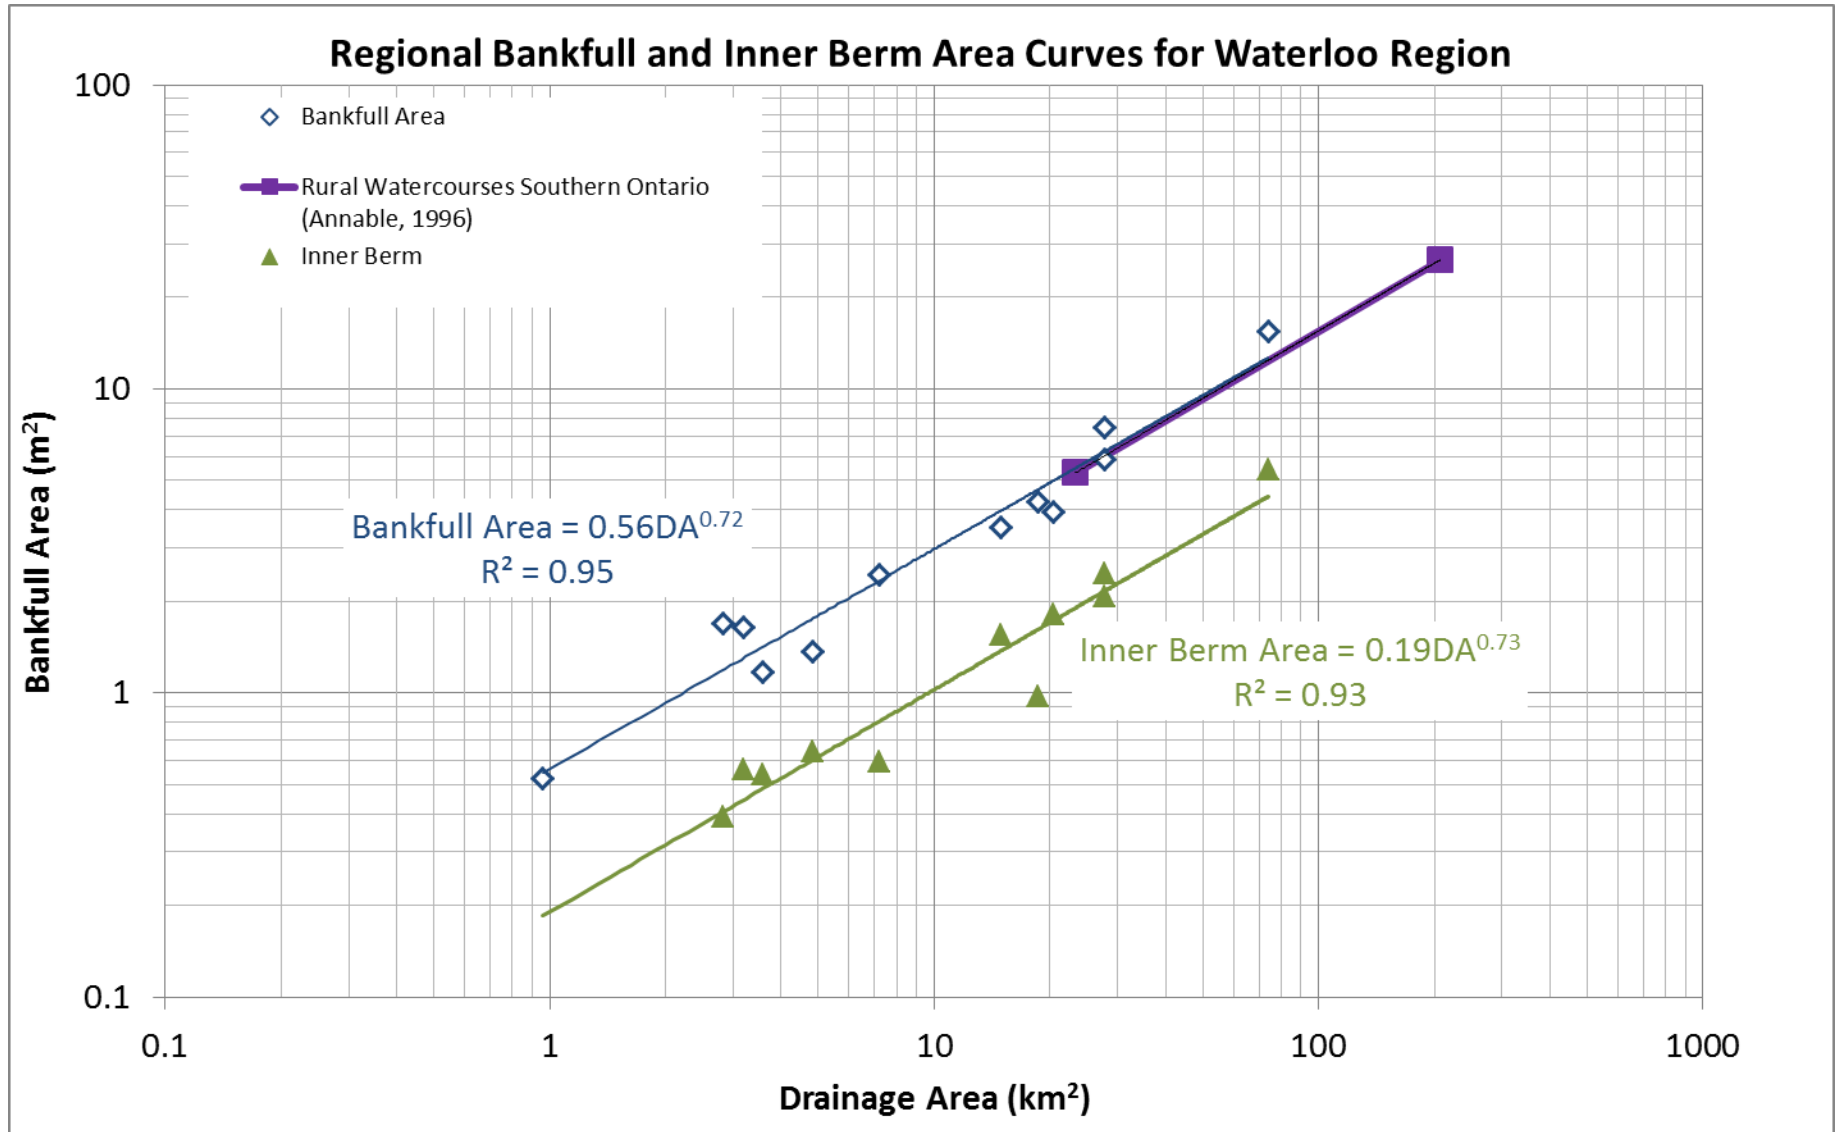

Peel Region

n = 10

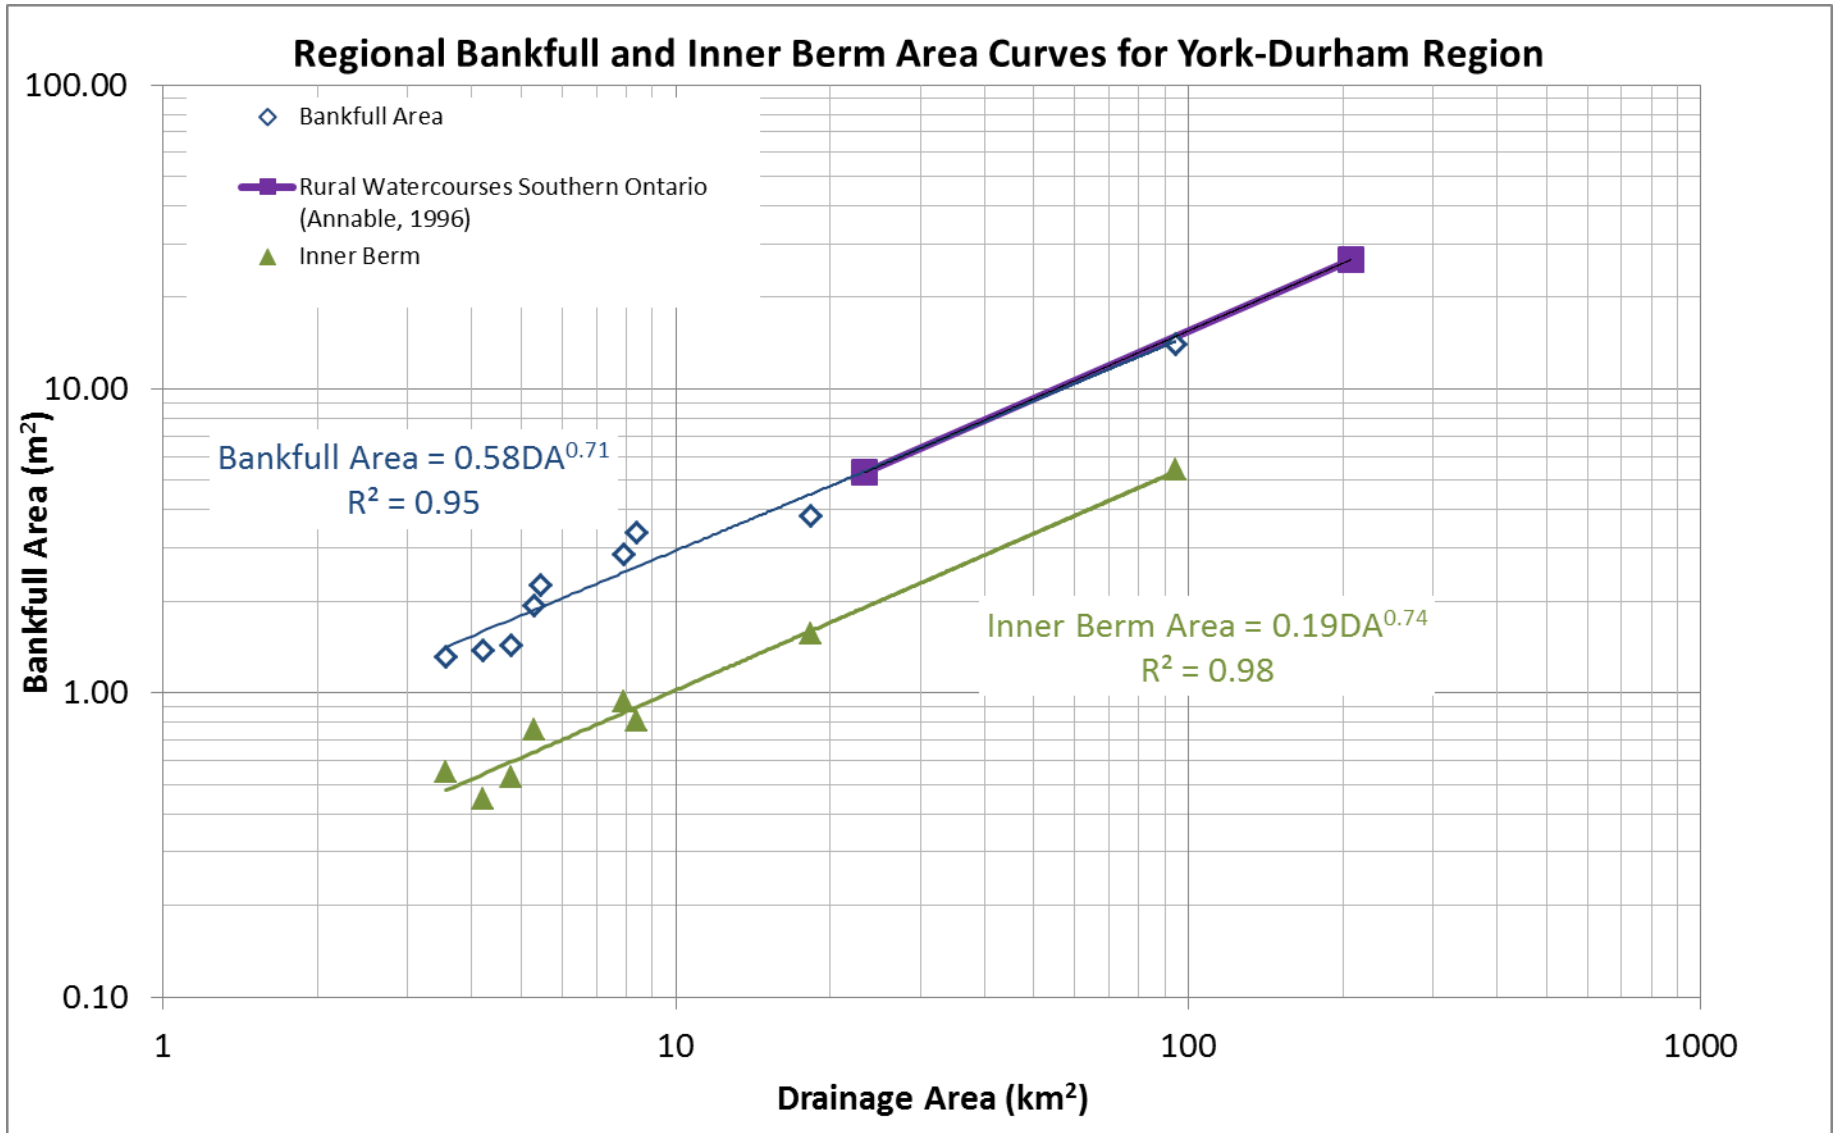

Waterloo Region

n = 12

York Durham Region

n = 9

Regional Comparison

Composite Curve

n = 31

Composite Curve

- Estimates of bankfull area in glacial sediments
- Waterloo, Peel and York-Durham Regions
- Inner berm area more sensitive to region

5 Summary

Regional Curves

- High correlation
- Represent actual stream dimensions in a region
- Check of other estimates of bankfull dimension

Regional Curves

- Support to designers
- Support to regulators
- Curve is incomplete
